DESCRIPTION

Paste for mummification and devitalization of deciduous teeth.

ACTION OF ACTIVE INGREDIENTS

• Paraformaldehyde, which gives off formalin slowly at body temperature, has a devitalising and mummifying action and therefore is an efficient sclerosing agent.
• Under its action a barrier forms in front of which sclerosis of the coronal pulp can be seen. Behind this barrier the periopical tissue remains unchanged.
• Lidocaine, a local anaesthetic, is included to prevent the patient from suffering discomfort during the devitalisation process.
• Parachlorophenol and camphor, which are widely used together in dentistry, are included for their antiseptic properties.

FORMULA

Parachlorophenol 8.00%  Camphor 13.00%
Lidocaine Base 36.00%  Paraformaldehyde 18.00%

INDICATIONS

Mummification or devitalization of a deciduous tooth.

CONTRA-INDICATIONS

Product should not be used if known allergy to lidocaine exists.

RECOMMENDED DOSE

Apply aseptically a pellet (about 10mg of paste) to the pulp. If desired, the product may be left permanently in the cavity. The above mentioned dose is to be used once, and on occasions, twice.

PRECAUTIONS

• Product should not be used if known allergy to lidocaine exists.
• The cavity must be carefully sealed with a cement to prevent any leaching of the product.
• Leaching can cause local destruction of the periodontium and necrosis of bone. It may also cause transitory but painful mucosal ulcers.
• Contents should be used within one year of opening. The cap should always be replace immediately after use and the jar kept in a cool dry place.

SHELF-LIFE

18 Months – This product should be used within 12 months of first opening.

PRESENTATION

4.5g Jar
